Chapter 4 Thermal Management

4.1 Overview

For reliability and operability concerns, the absolute maximum junction temperature has to be below 125°C.

4.2 Package Thermal Characteristics

Table 4-1 provides the thermal resistance characteristics for the package used on the SoC. The resulting simulation data for reference only, please prevail in kind test.

Table 4-1 Thermal Resistance Characteristics

| Parameter | Symbol | Value | Unit | Note |
|--|---------------|-------|--------|------|
| Junction-to-ambient thermal resistance | θ_{JA} | TBD | (°C/W) | (1) |
| Junction-to-board thermal resistance | θ_{JB} | TBD | (°C/W) | (2) |
| Junction-to-case thermal resistance | θ_{JC} | TBD | (°C/W) | (3) |
| Thermal characterization parameter | ψ_{JT} | TBD | (°C/W) | (4) |

Note (1): The package-board system is placed in the natural convection (JEDEC JESD51-2 standard), and the 2S2P test-board is designed in accordance with JESD 51-7/JESD 51-9. The actual system design and environment may be different. (The PCB is 4 layers, 114.3 mm*101.6 mm)

Note (2): θ_{JB} is measured in the special environment (JEDEC JESD51-8 standard), and the printed circuit board used to mount the devices is specified in JESD51-7.

Note (3): The thermal resistance θ_{JC} is provided in compliance with the JEDEC JESD51-14.

Note (4): ψ_{JT} - The thermal characterization parameter to report the difference between junction temperature and the temperature at the top center of the outside surface of the component package, ψ_{JT} is measured in the test environment of θ_{JA} (JEDEC JESD51-2 standard).
